TREE DRENCH

HPTA® MEMBER
HUMIC PRODUCTS TRADE ASSOCIATION

"When the leaves start to turn color is the time I start my fall drench of Sea3. The fall is my foundation application but I do this drench throughout the season depending on the health of the tree. I use this application not only for recovery but also for maintenance of important landscapes. I never miss the fall application because I know the timing of storing all the carbohydrates and nutrients from Sea3 into the root system is so important to help to get a strong leaf-out in the spring."

~Bobby Solar, Solar's Tree Care

Bobby uses a 1% solution of **Sea3** and roughly 1 gal of solution per 1 inch DBH (Diameter at Breast Height). That's a good starting point, but there is a large window of use rates anything from 0.25% solution (2 pints per 100 gal) to 5% solution (5 gal per 100 gal) for trees that are really struggling to survive.
